# Who Benefits from Robo-Advising? Evidence from Machine Learning

Alberto G Rossi University of Maryland & Georgetown

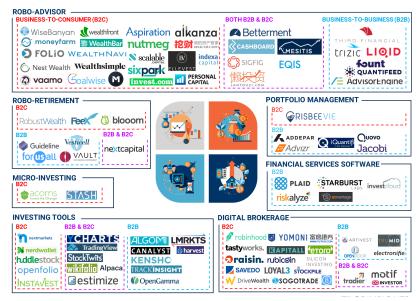

> Stephen Utkus Vanguard

ABFER, May 2019

## **Motivation**

- Most investors are not financially savvy
- Financial Advisers could help, but they
  - are expensive
  - generally ineffective (Linnainmaa, Melzer, and Previtero, 2016)
- Robo-advising potentially helpful
  - cheap and easy to use
  - can reach millions of people at low costs

# **Motivation**

## Research Agenda on Robo-advising

The Pros and Cons of Robo-advising to Investors

- "The Promises and Pitfalls of Robo-Advising," (RFS, Forthcoming)
- "Who Benefits from Robo-Advising? Evidence from Machine Learning"

#### How Robo-advising interacts with other forms of advice

- Complementarity and substitutability between men & machines
- What do investors value in financial advice

# **This Paper**

Vanguard's Personal Advisor Services (PAS)

- largest hybrid robo-adviser in the world
- \$120B under management
- explosive growth since inception

#### The paper in a nutshell:

- effect of robo-advising on portfolio allocation
- who benefits from robo-advising

# Main findings

#### Across all clients:

- Portfolio Holdings:  $\uparrow$  bond,  $\downarrow$  cash,  $\approx$  equity
- Investment Vehicles: ↑ mutual funds, ↓ Individual stocks, ↓ ETFs
- Mutual Fund Characterstics: ↑ Indexed Mutual Funds, ↓ Fees

#### Heterogeneity in robo-adviser effects:

- High benefits: clients with little experience, high cash holdings & trading
- Low benefits: clients with high share in mutual funds, high indexation

#### Data

- Sample of 350,000 clients that interacted with PAS
  - Trades
  - Monthly positions
  - Demographic Characteristics : Age, Gender, Tenure, etc...
  - Mutual fund characteristics and returns
  - Stock Characteristics and Returns

 $\rightarrow$  Construct investor characteristics & investment performance

## Client Characteristics at PAS Sign-up

#### Panel A. Demographic Characteristics

|         | N      | Mean  | St. Dev | Median |
|---------|--------|-------|---------|--------|
| Age     | 80,690 | 63.22 | 12.80   | 65.00  |
| Male    | 82,526 | 0.53  | 0.50    | 1.00   |
| Married | 82,526 | 0.36  | 0.48    | 0.00   |
| Tenure  | 82,498 | 14.18 | 9.30    | 14.17  |

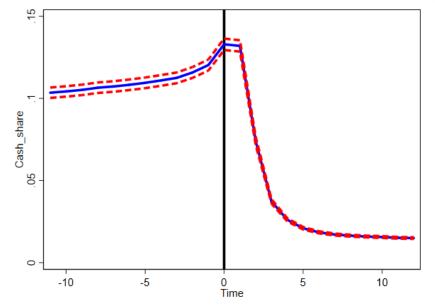

### Client Characteristics at PAS Sign-up

|                      | Panel B. Portfolio Allocation |           |           |           |
|----------------------|-------------------------------|-----------|-----------|-----------|
|                      | Ν                             | mean      | St. Dev   | Median    |
| Wealth               | 82,526                        | \$588,245 | \$832,296 | \$282,449 |

#### Some of the plots can be misleading: Equity Shares

## PAS and Portfolio Characteristics

Equity share changes for low and high Equity holders at sign-up

# Who benefits from Robo-advising?

Focus on two measures:

- change in portfolio allocations
- change in investment performance

Problem:

- Not clear what investor characteristics matter ex-ante
- Not clear if the functional relations btw:
  - regressors
  - regressands

are linear and/or monotonic

• kitchen sink linear regression are likely to overfit

 $\rightarrow$  use machine learning tool known as Boosted Regression Trees  $\rightarrow$  let the data speak

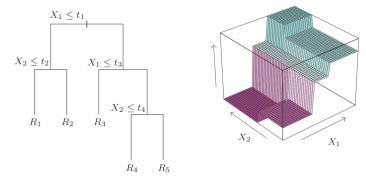

#### **Regression trees**

A regression tree,  $T_J$ , with J regions (states) and parameters  $\Theta_J = \{S_j, c_j\}_{j=1}^J$  can be written as

$$\mathcal{T}(x,\Theta_J) = \sum_{j=1}^J c_j \ I \ (x \in S_j).$$

- $S_1, S_2, ..., S_J$ : J disjoint states
- $x = (x_1, x_2, ..., x_P) : P$  predictor ("state") variables
- The dependent variable is constant, c<sub>i</sub>, within each state, S<sub>i</sub>

## **Regression Trees: Intuition**

Key features:

- Partitioning using lines parallel to the coordinate axes
- Recursive binary partitioning
- Very hierarchical
- Use less and less data  $\rightarrow$  overfit

# Boosting

A Boosted Tree Model is a sum of Regression Trees:

$$f_B(x) = \sum_{b=1}^B \mathcal{T}(x; \Theta_{J,b}).$$

The B-th boosting iteration fits a tree on:

$$\hat{\Theta}_{J,B} = \arg\min_{\Theta_{J,B}} \sum_{t=0}^{T-1} \left[ e_{t+1,B-1} - \mathcal{T}(x_t;\Theta_{J,B}) \right]^2$$

where

$$e_{t+1,B-1} = y_{t+1} - f_{B-1}(x_t)$$

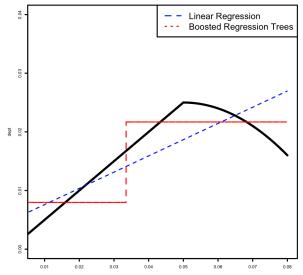

are the residuals of the model with "B-1" iterations.

To minimize the current residuals, the B-th tree finds:

- The optimal splitting regions, S<sub>j,B</sub>
- The optimal constants, c<sub>j,B</sub>

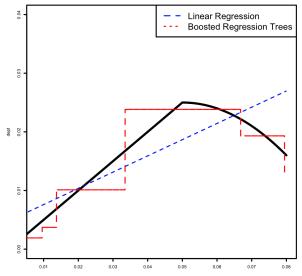

## BRT vs linear models

#### **1** Boosting Iteration

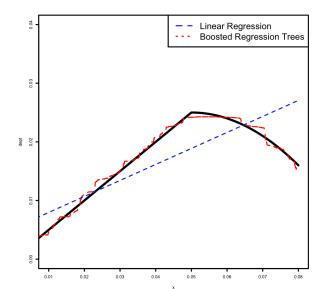

# BRT vs linear models

#### **5** Boosting Iterations

# BRT vs linear models

#### 10,0000 Boosting Iterations

# Why don't BRT overfit?

- Small Trees: Each tree fitted has only two states, J = 2
- Shrinkage: Parameter, λ = 0.001, determines how much each tree contributes to the overall fit:

$$f_{\mathcal{B}}(\boldsymbol{x}_t) = f_{\mathcal{B}-1}(\boldsymbol{x}_t) + \lambda \sum_{j=1}^{J} c_{j,\mathcal{B}} I\{\boldsymbol{x}_t \in S_{j,\mathcal{B}}\}.$$

- Subsampling: using half the data to fit each tree
- Objective function:

$$MSE = \frac{1}{T} \sum_{t=1}^{T} (y_{t+1} - f(x_t))^2 \text{ or } MAE = \frac{1}{T} \sum_{t=1}^{T} |y_{t+1} - f(x_t)|$$

- Key Parameter to Choose: Number of Boosting Iterations
  - Baseline results: 10,000 iterations, but conduct sensitivity analysis

## Are BRT a Black Box?

#### NO!

Much more intuitive and interpretable than other AI techniques

Possible to obtain

• Relative Influence Estimates:

Relative importance of each predictor variable in a model

• Partial Dependence Plots:

Recovers functional relation btw regressand and each regressor

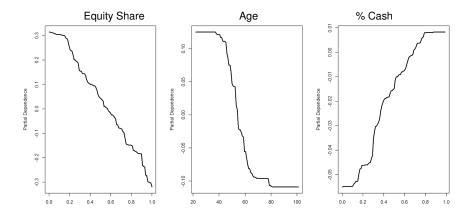

# Use BRT to Explain Portfolio Changes

Approach:

- Model the pre and post-PAS Equity Share using BRT
- 10,000 boosting iterations
- Covariates:
  - 4 Demographics: Age; Married; Male; Tenure
  - **7 Portfolio:** %Equity; %Cash; %Mutual Funds; %Stocks; %ETFs; %Indexed Funds; %Emerging Funds
  - 4 Trading: Management Fees; Number of assets; Volume; N. of Transactions

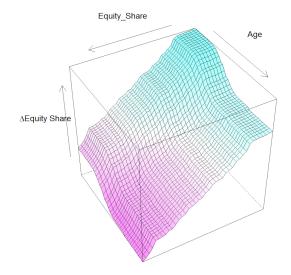

## Use BRT to Explain Portfolio Changes

#### Equity Share (81.9%); Age (15.6%); Percentage in Cash (2.1%)

## Use BRT to Explain Portfolio Changes

#### Bi-variate Plots: Equity Share and Age

# Comparison with linear model (Significant Regressors)

|                  | Linear Model | BRT          |

# Use AI to Explain Performance Changes (Relative Influence Measures)

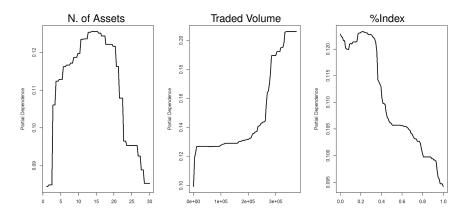

# Use AI to Explain Performance Changes (Partial Dependence Plots)

#### Some make a lot of economic sense

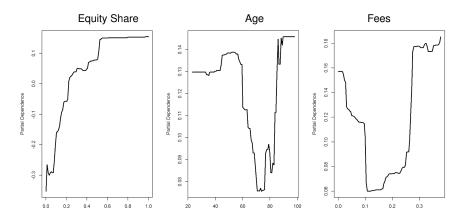

# Use AI to Explain Performance Changes (Partial Dependence Plots)

#### Some make a lot of economic sense

# Use AI to Explain Performance Changes (Partial Dependence Plots)

#### Some are more challenging

## **Out-of-Sample Performance**

Crucial to evaluate the out-of-sample performance of BRT to

- Establish we are not over-fitting the training data ...
- ... and capturing the true structural relation btw the variables

Do the analysis on both:

- Changes in portfolio allocation (Easy)
- Changes in investment performance (More Challenging)

BRTs outperform linear model both in- and out-of-sample

BRTs out-of-sample performs better than linear model in-sample '

### Conclusions

Use AI to study which investors benefit the most from PAS

- Difficult to know what factors matter *ex-ante*
- Not clear if the relations are linear and/or monotonic ex-ante
- BRT uncovers significant non-linearities
- BRT performs well in- and out-of-sample

# **Out-of-Sample Performance**

Crucial to evaluate the out-of-sample performance of BRT to

- Establish we are not over-fitting the training data ...
- ... and capturing the true structural relation btw the variables

Do the analysis on both:

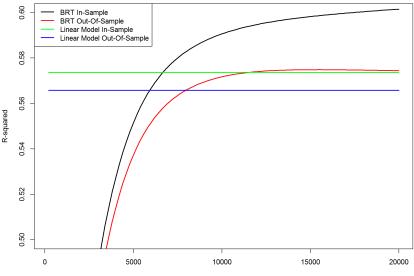

- Changes in portfolio allocation (Easy)
- Changes in investment performance (More Challenging)

# **Out-of-Sample Performance**

#### Cross-Validation Exercise:

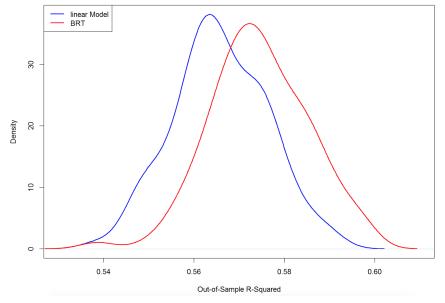

- Use a BRT model and a linear model with the same covariates
- Estimate the model on all observations except for 1000 observations randomly removed
- Test the model on the remaining 1000 observations
- Compute in- and out-of-sample R<sup>2</sup>
- Compute the analysis 1000 times and average the results across simulation rounds

### **Results for Portfolio Changes**

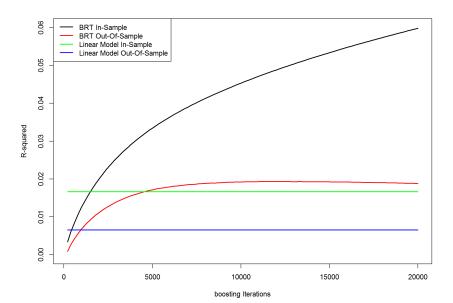

boosting Iterations

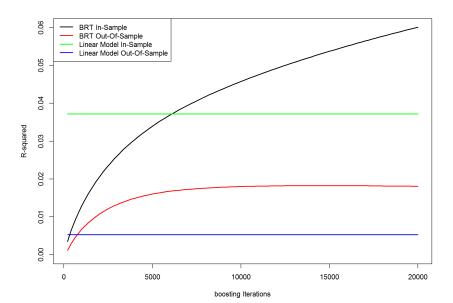

## **Results for Portfolio Changes**

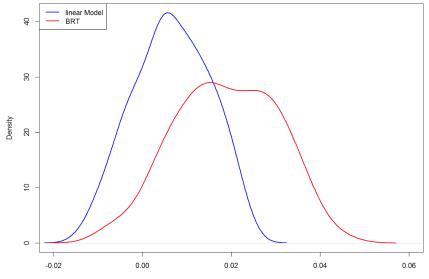

### **Results for Performance Changes**

### With Higher Order Terms

### **Results for Performance Changes**

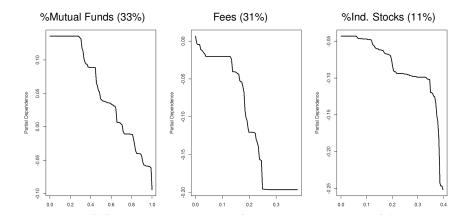

Out-of-Sample R-Squared

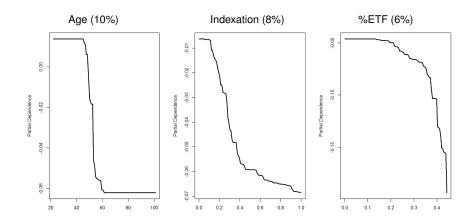

### Comments

- We can explain a lot of the variation in portfolio changes
- Only small part of the variation for investment performance
- Mean-Squared-Error is not an ideal measure of performance
- BRT outperform linear model both in- and out-of-sample
- BRT out-of-sample performs better than linear model in-sample

### Use AI to Explain Portfolio Changes-No Equity Share

### Use AI to Explain Portfolio Changes-No Equity Share

 $R^2 = 26\%$ 

## Portfolio Holdings of PAS and non-PAS clients

#### **Top Mutual Fund Tickers in January 2017**

|      | NON-PAS |               |        | PAS           |  |
